

Patent Pending Features

- Fast, easy, and accurate
- Quick-change vice clamp
- Time and money saving
- Sharpens virtually any blade
- Patent pending parallel suspension keeps a perfect angle every time
- Heavy-duty, low-wear industrial design
- Decreases field turnover

Sharpening at the factory recommended angle ensures grass blades are subjected to less stress, and therefore produces a greener, healthier look to your field or lawn. The Zorro Blade Sharpener™ guarantees a consistent, accurate and precise cutting edge. The Zorro™ design allows the operator to produce a uniform angle as close to OEM specs as possible. The versatility of the sharpener is adjustable for any mower blade regardless of rotation direction, length, or angle. This sharpener even works with replaceable short tips and mulching blades.

“Fast, easy, and accurate” is the customer feedback we continually receive. The Zorro Blade Sharpener™ stands out because of its patent pending design.

Intuitive Design- this simple design is easy to understand, and operate with minimal training.

Parallel Grinder suspension- Keeps the grinding surface of the angle grinder parallel to the floor

at every possible position. It keeps stress off of your arms and shoulders while maintaining perfect accuracy.

Consistent and Quick Transition- the parallel arm grinder maintains a straight and steady stroke for an accurate cut. A quick stow grinder position suspends the grinder out of the way for switching blades and storage.

Industrial Durability- made from quality materials down to the matte industrial powder-coat finish, and greaseless limited-wear composite bushings; designed to withstand the roughest and dirtiest workspaces.

ZORRO™ BLADE SHARPENER

**Sharpen Blades
Fast,
Easy,
Accurate
Every Time**

A Quality Product Made By:

As shown above a properly sharpened blade reduces the amount of contact with the remaining blade. A dull or improperly sharpened blade, as depicted below, allows too much contact with the remaining portion of the grass blade increasing chances of shattering the tip of the grass blade, leaving it at a higher risk for discoloration and disease.
